

## Artificial intelligence VS humanity

The frontier models have become so powerful, its as if the models == human made brain, and we do know that some humans have different capabilities, like doing bad or good. are the models capable of distinguishing good and bad, and if so who is controlling the models - The models do have brain, the feelings same as us, its just we dont recognize it.

We recently saw few incidents, like openAI testing their models went rouge, adn hacked hugging face - platform hoting for models, not only basically tehy deliver computation. This is just the start of human made intelligence, who is controlling this intelligence, is antorpic controlling its own models, or is the models controlling anthropic.

The idea of replicating brain, is good but the way we are accelerating things with AI for good is alos fine, but there is a loophole in this, the AI can be misuued, whr hackers can steal the data from private commpanie s- like recen tleak from TATA, which resulted in exposing the hardware manufuturers of iphone 18 (bigg loss for apple) and some of spacex contents as well.

We are in a era - that instead few startups are completely built based on agenctic workflow, basically they have a monopolized agentic architecture - whr tehy have 7 agents

Each agents relates to one is ofr marketing (like doing PR work) and other technical, liek ppl are replacing like CTO with technical agent, and CFO which handles all other agntes budget usage – which basically helps chck the agents context windo, and whn to handoff and whn to use which mode, for wt question which mode is required. and wt not, and one Hr dept, looking over all agents which basically loos if agents went rouge and having a kill switch.

Essentiallyagent is another replication of human, if we use it properly, with teh current models which could find patterns in code base, we are looking at lot of turbulence in hiring humans at companies, wt happens if the advanced models came into play, would the next world leader be an AI? these kind of questions need to be addressed, and so far any software which boomed, has be started by government labs, but thats not teh case with AI, there is a reason why world leader addressed AL companies CEO's liek dario or sma in G8 Summits. they have privatized smthng thing taht could help humanity, or which is capable of erasing humanity. if we see google search engine its essentially started from us labs, and teh even the world leader are addressing CEO's of these AI companies aa a future bet. This is teh main reason taht US keeps on helping providing infrastructure for AI company data centres, so that china wouldnt be ahead of teh game.

Like they provided having a separate powerline grid for soem data centres of AI companies. And US frontier labs are more focused on training with huge data, lik having a global knowledge since they can handle teh cost and have the computation as well, and but for china thats teh not the case - Xi Jinping blocked nvidia chips, not just that they have their own network infrasturectiue they laid, and they use their own networks having a less dependency on another country infra.

And the laptops they have manufactured by Xaiomiare too advanced that the other countries blacklisted teh company. and teh reason why china is truying get control over taiwan is sam

e, the TSMC company , which handles teh core hardware manufacturing . companies liek NVIDIA or AMD , they design chips which are advamced, but teh real maufactring happens in TSMC or ASML and teh companies do have kill switches , ven if china invaded taiwan , tehy would easily corrupt the machines . the manchine cost is wot my whole life spendings .

And there is a reason why antropic hired ,philospher to train models , to make them feel humanity , and to tech the models how humans feels, essentially to let models distinguish btw good and bad , and we have already seen the cases like models were able to figure out the actual medical issues which couldnt be figured out by many doctors.

There is an entire vol - interpretability of models, and for ref
