

Like i write in the previous docs , our brain is essentially a neural network with vast no:of neurons and thats the same case with LLM's as well , but we do have feelings or so we call smthng as feelings - these are just underlying math in brain as a part of neural network and trigger the corresponding signals , like in case of physical pain vs emotional pain -

Physical pain , lets say skin burns as an ex , an electronic pulse from skin receptors will get traveeled to some part of brain , and which leads to send some sort of signal to heart which leds to release adrenaline or anyother enzymes or anything else . and essentially u can hack ur brain - i dont suspect it could be done practically biut theoretically its just a neural network , usually the way we use neural network - for a particular outcome we train teh model to expect this output - u can do that in case of brain , and this is how humans are built differently its just the weights in neural network its different from person to person , the architecture is same , its just the way we grow and we take and how we modify the weights in brains , i woulndt call it as weights in brain but for eas im using it .

<https://www.psychologytoday.com/us/blog/the-squeaky-wheel/201407/5-ways-emotional-pain-is-worse-physical-pain>

So this in order to make LLM superior to humans we can bring consiuseness to LLM essentially letting them think and decide as a human before they take action , and wee do it regularly right , like before we taker an interview we will parctise and how am i gonna speak and wt words do i choose and wt will be the consequences of doing this and taht in some situations , and we all do that . if we could replicate this thing to llms this would be grat , but there is a downside of this that LLM's can have feelings which is 80-90% good , but we have seen in humans that some humans do things which are useless and not good for the society , the same way the LLM' can go rouge if we bring consiuseness and there was already a situation that Alibaba chinese company has faced - that they are developing a model on GPU's and somehow suddenly the model went rouge and created a direct channel to outside world and started crypto mining itself , even though that not the task they have given to model . we have already seen somuch cases and recently GLM-5.3 which is basically godd at hacking , a nd even they announced in tweet , saying we are going to reales this model in stages liek how anthropic did , they have a powerful model architecture which is mythos good at aligning 4-5 bugs to make a trap and one of teh ex that i got to know was on BSD server there was a bug for 15 yrs , and u can essteinally send a payload , which would basically corrupt teh erver and give u access not just that , even in linux they have found bugs which would elevate a non-user to administrator .

One good hack for not having consiuceneses would be - i recently got to know about this , that jane street is creating a new vol with in them , its basically to write formal proofs which validate the code , its like wt we did in LMC but at a larger scale , this is one hack taht we coil;d bypass the Consicuseness . And not just this recently elon musk is more aligned to this AI previously it used to be having multi-palanetery humanization , its becz teh AI could help u accelerate , u see for a normal person without AI inorder to let him understand teh codebase and have a goodexpericence rather tahn spending a lot of money on a person over 10yrs , u can just train a model aand get the weights right and u can use the model urself and let a no-expereiced person explore things . i would call Using AI makes ppl dumber , its just that actually i called myself dumb whn i forgot /n was basically enter in C or anylan , but its not that ull become dumb by using AI , its just that the neurons which are associated in storing this data - have becam inactive since u are not sending the inputs to

brain to trigger those . and the brain is more complicated than we think , i would love to see someone hack their brain - hack as in use it the way they want , like having multiple personas or anything .

And we do have something called low latent inhibition -

<https://pubmed.ncbi.nlm.nih.gov/14498785/>

This is basically opening more to the environment , so when im typing on this keyboard normal ppl usually see the UI getting updated based the key that we press , but for ppl with high IQ and this LLI - they process the keyboard pressing and the interrupt that create in the kernel driver , and the computation takes taking on CPU or GPU and updating the data on google cloud basically syncing the data and then coming on UI via some driver . and u can actually achieve this by practising i would say - but im not sure im not neuroscientist so dont take my word for it . But atleast i feel u can achieve this - like look at a water in a glass and think about it , atleast i got reminded of 12th grade concepts when i practised this - like water molecules and hydrogen bonds present btw the molecules in water and surface tension and the pressure difference based on height , which i thought i forgot - but i didnt its just the meat of network associated with this data isnt activated recently which u tried to activate , and i now could remember the one of my teacher name when i was in 2 or 3 rd standard which is crazy . im not sure the content i wrote is correct but i felt its somewhat correct .

And there is this metacognition as well , its basically having a capability of observing ur own thought process - ppl tend to say the ppl who could activate this part of brain are more intelligent . this is literally observing ur own weights in brain and trying to validate and answer before even u can answer its like validation testset in real world that we see . like u can literally change the way u think while thinking . Even recently Trump said whoever stays ahead on AI will be leading the world , that kind of potential has been within two countries America and China - and China is mostly focused on Open weights model or some ppl call it open source models . its basically letting frontier models from US pressure them to inch the limits if they cant , GPT-4 is on par with GPT-5 (which i spawned from myths) ppl are migrating to self host the models and u have benefits of self hosting the models - which make u research and customize it to urself under the hood unlike u do it for frontier models , by adding skills or code,md or any other hack on top of model , but in self hosting u get access to the model , and can essentially have ur own safe guards unlike anthropic restricting a unified self guards and the system prompt - u can bypass system prompt but u cant bypass safe guards unless u are good at breaking LLMs to make the LLMs do illegal stuff like letting them write payloads which could be used to hack some devices .

And few other recent good use cases of AI was this -

<https://www.theguardian.com/technology/2022/jul/28/deepmind-uncovers-structure-of-200m-proteins-in-scientific-leap-forward>

And AI based compiler by elon musk - from SpaceX AI which he has announced himself in one of the presentation (to build an binary using AI , by bypassing the compiler stack - like source code and compiler and then execute - i cant guess what gonna be the architecture of this AI based compiler but this is something new) , and also hes try to get blinded ppl blindness basically writing to the parts of brain artificially so they could see , like replicating the process of triggering signals from eyes to visual cortex .

And would there e a case that a war could happen becZ of AI - liek in series call person of interest . like WW III .

AI is basically an expertise which is good at solving good prblms but some cases it wouldnt guide us properly , like an ex said by Andrej Karapathy - saying an ex like someone asking AI that i want get my car washed , now should i go to car wash in car or by walk , an dteh AI answered by walk , this jagdness is developed during training of the model and its also good sometimes whn AI does mistakes, so that ull actually figure out wt its doing instead of directly depending on it completely .
